MTEN 307: PHASE EQUILIBRIA OF MATERIALS (2 Credits)

INSTRUCTIONS:
ANSWER ALL QUESTIONS.

TIME ALLOWED: TWO (2) HOURS

1.

a.

- i. For an evaporation phase equilibrium on a one component phase diagram, show that

$$P = P_o e^{\left(-\frac{\Delta H_{vap}}{RT}\right)}$$

Where P is the pressure on the system, T is temperature of the system, R is the gas constant and ΔH_{vap} is the heat of vaporization.

- ii. Determine the heat of vaporization of water using Figure 1 on Page 2 for the water system. NB: $760 \text{ mmHg} = 1 \text{ atm} = 101.3 \text{ kPa}$

- b. From Figure 2 (Page 2), indicate whether the following statement is true or false.

- L is denser than S_2 .
- S_1 is denser than S_2 and the transformation from $S_1 \rightarrow S_2$ is exothermic.
- S_1 is less dense than S_2 and the transformation from $S_1 \rightarrow S_2$ is endothermic.
- L is less dense than V .

25 Marks

Figure 1 The Water System

Figure 2

2.

- a. For the binary system A – B, component A melts at a higher temperature than B. The system forms a simple binary eutectic diagram. Sketch and label the phase diagram for the A – B system.
- b. Using Figure 3 (Page 3), answer the following questions.
 - i. Identify all the invariant points and write out the relevant invariant reactions. Present your answer in a table format with one column for temperature, another for composition and the other for the invariant reaction.
 - ii. Mg_2Pb is an intermediate compound, describe its melting behaviour.
 - iii. Conduct an isoplethal analysis for a molten alloy containing 10 wt% Pb and sketch the equilibrium microstructure of the resulting alloy.
- c. With the aid of an appropriate reaction, define an incongruently melting compound.

Figure 3

3. Use Figure 4 to answer the following questions. Use and attach the extra print out of this figure where necessary.

- a. Indicate the two compatibility triangles in the system and identify the temperatures and compositions of their invariant points? Tabulate your answer with a column for composition triangle, another for temperature of invariant point and the last for composition of invariant point.
- b. Write and name the respective ternary invariant reactions in the system.
- c. Make a sketch of, and label the isothermal sections at 700 °C.
- d. For a material of composition A=20%, B= 45% and C = 35%, at 700 °C, determine the equilibrium phases and quantify their relative amounts.
- e. A melt has composition that is located at the intersection of the Alkemade line C – AB with its boundary line. Upon solidification of this melt, what will be the final crystals and how much of each will be found in the microstructure?
- f. For a melt of composition A=40%, B= 30% and C = 30%
 - i. What crystalline phase will be the first to form upon cooling?
 - ii. What is the phase composition of the final crystals?
 - iii. What is the composition of the final liquid to solidify?
